

*** SPECIAL NOTICE ***

RADSL Connection Considerations:

There are several steps that you must take to maximize loop reach of your RADSL product:

- Use only CAT3 or better twisted-pair network connection cables for RADSL Termination Unit connection and interface patch cabling. Untwisted analog cables, of any length anywhere in the loop, substantially contribute to crosstalk and reduced loop reach.
- Ensure the main bundle of the loop is standard twisted-pair voice cable (i.e., CAT3).
- Choose non-adjacent wire pairs within the main bundle whenever possible.
- Use only non-conditioned loops (no load coils, echo suppression, etc.).
- Eliminate any non-twisted cable from the loop.
- Always keep TIP and RING in the same twisted-cable pair.
